

Hotel Management System

SQL & Power BI — Guest, Revenue & Staff Operations Dashboard

A two-part Power BI reporting system built on a relational SQL database, designed to give hotel management a full operational view — from guest-facing bookings and revenue to internal staffing and room-service activity. One dashboard tracks the guest and revenue side of the business; a second, internal-only dashboard tracks staff performance and service operations.

Guest & revenue dashboard — bookings, room mix, rates and stay duration

Guest & Revenue Reporting

- Tracks 100 bookings across 10 guests and 10 rooms for the reporting period, with \$35.01K in total revenue
- Room-type breakdown (Suite, Double, Single) shown by booking share and by average nightly rate
- Daily check-in trend chart and an average stay-duration gauge (1.76 days) for occupancy planning
- Filterable by room type and date range; full guest directory table with contact details for front-desk lookup

Internal operations dashboard — staffing, room service and payment breakdown

Internal Operations Reporting

- Separate internal-only dashboard covering 100 room-service orders and 10 staff members
- Room-service orders broken down by reason (breakfast, dinner, ironing, dry cleaning, etc.) using a tree map
- Staff directory with role, schedule and total orders handled per staff member, for workload visibility
- Revenue split by payment method (cash vs. credit card) and total tax collected tracked alongside stay duration by check-in date

Database & Data Model

Both dashboards are powered by a relational SQL database structuring bookings, guests, rooms, staff and room-service orders as related tables, allowing revenue, occupancy and staffing metrics to all be sliced by the same date range and filters.
